

# Vending Machine Sketch

# Vending Machine Diagram

## Components And Their Responsibility

### Display

- Updates message on LED display

### Vending Mechanism

- Monitors 3 button product selection keypad
- Returns keypad selection when queried
- Returns inventory for products when queried
- Dispenses indicated product when commanded
- Decrements inventory count for a product after it has been dispensed

### Logic Controller

- Implements all business logic
- This is the “brains” of the machine
- Manages the overall state of the vending machine
- Orchestrates interactions between components
- Processes user input and system events
- Makes decisions based on current state and conditions

### Coin Mechanism

- Accepts valid coins and ignores invalid coins
- Keeps track of pending transactions balance
- Keeps count of each coin in the machine (e.g. 10 quarters, 5 nickels, 10 dimes)
- Keeps total amount of coins in the machine (e.g. \$3.70)

- Dispenses coins for making change and returning canceled transaction. Note: it does not make calculations. (e.g. product costs \$0.65 and user inserted \$0.75 the Logic Controller would instruct the Coin Mechanism to dispense 1 dime)
- Monitors Coin Return (Cancel Transaction) when enabled
- Returns balance in Pending Transaction when queried
- Returns total balance in machine when queried
- Returns counts for each coin type in the machine

# Logic Controller State Machine

## States

1. Power Up
2. Idle
3. Pending Transaction
4. Product Selected
5. Insufficient Funds
6. Sold Out
7. Exact Change Only
8. Return Coins
9. Transaction Complete

## Events for Transitions

1. Insert\_Coin
2. Select\_Product
3. Cancel\_Transaction
4. Cannot\_Make\_Change
5. Dispense\_Product
6. Return\_Coins
7. Power\_Up\_Complete
8. Out\_Of\_Stock
9. Amount\_Too\_Low
